

Introduction

Model 101 / TL14 (Mach II Version, customised for QFRS)

The rungs and stiles of the German telescopic Waku Ladder / Step Ladder are made from high strength aluminium profiles. It is a versatile ladder and can be used in many combinations, such as the following:-

An Extension Ladder

The central locking mechanism enable the conversion to a straight ladder that can also be adjusted, rung by rung, up to almost four times its initial height.

A Step Ladder

It is adjustable rung by rung. Four strong spring axles permit to adjust it safely, to almost twice its initial height. Therefore one ladder substitutes for a complete range of step ladders of different heights.

A Staircase Ladder

Each side being adjustable independently, it enables the user to leave a side shorter to offset the step ladder or on uneven ground like a slope.
